

Assignment 1 Pre-Work Checklist

Complete this individually before your group's role-play session. This is logistics setup for the whole course, not just part of the requirements deliverable. You will use these tools starting in Assignment 2.

- Install a code editor (VS Code recommended).
- Install Git and confirm it works by running: `git --version`
- Create a GitHub account or use already created one. This is the account you will use for the whole course.
- Create the group's GitHub repository. One member should create it and add the rest of the group as collaborators.
- Invite your assigned TA as a collaborator on the repository.
- Confirm that every group member can clone the repository.

Submit confirmation of the last three items with your Assignment 1 submission. This can include the repository link, a screenshot of the collaborator list, or equivalent evidence.

Requirements Quality-Check Worksheet

Use this worksheet on both your group's consolidated requirements list and the AI-generated requirements list. Complete one copy of the worksheet table for each list.

For every requirement, mark each of the six attributes as **Pass** or **Fail** and add a short note explaining any failure or borderline case. A single requirement can fail at more than one attribute.

Attribute Definitions

Attribute	Question to Ask
Conflict	Does this requirement contradict another requirement, for example, one from a different stakeholder?
Ambiguity	Could two reasonable people read this requirement and implement it differently?
Completeness	Is anything missing that is needed to act on this requirement, such as thresholds, who is responsible, or when it applies?

Consistency	Does this requirement use terms and definitions in the same way as the rest of the list?
Testability	Could you write a concrete pass/fail test for this requirement as written?
Evolvability	Is this requirement written in a way that would break or require a full rewrite if a small related feature were added later?

Worksheet Table

#	Requirement (as written)	Source (role/stakeholder)	Conflict	Ambiguity	Completeness	Consistency	Testability	Evolvability	Notes / Resolution
1									
2									
3									

Add rows as needed.

Create one copy of this table for each of the following:

- Your group's consolidated requirements list.
- The AI-generated requirements list.

Resolving Failed Requirements

For every requirement that fails an attribute, write 1 to 2 sentences explaining how you resolved it. For example, you may:

- Rewrite the requirement.
- Split it into two requirements.
- Flag it as an open conflict for the client to decide.
- Discard it if it is not appropriate or relevant.

For conflicts specifically, do not simply pick one side. Document the conflict, identify which stakeholder holds each position, and provide either a possible compromise or an explicit note that the issue remains an open decision for the client, such as the Director or Operations Manager.
